

w/ property that $\forall x \in U, \exists B \subseteq U$
w/ $x \in B, B \subseteq U$

Claim: T in above is in fact a topology

Eg: ① $X = \mathbb{R}^n, T = \text{open sets in } \mathbb{R}^n$
 $B = \text{all balls } D^n(x, r) \quad \begin{matrix} x \in \mathbb{R}^n \\ r \in \mathbb{R}^+$

② $X = \mathbb{R}^n, T = \text{open sets in } \mathbb{R}^n$
 $B = \text{all balls } D^n(x, r) \text{ s.t. all coordinates of } x, r \text{ are rational.}$
