Group acting on Λ trees

Olga Kharlampovich (McGill University)

Cornell, 2011

- 4 同 6 4 日 6 4 日 6

This talk is based on joint results with A. Myasnikov and D. Serbin.

э

The starting point

Theorem . A group G is free if and only if it acts freely on a tree.

Free action = no inversion of edges and stabilizers of vertices are trivial.

Ordered abelian groups

 $\Lambda =$ an ordered abelian group (any $a, b \in \Lambda$ are comparable and for any $c \in \Lambda$: $a \leq b \Rightarrow a + c \leq b + c$).

Examples:

Archimedean case:

 $\Lambda = \mathbb{R}, \ \Lambda = \mathbb{Z}$ with the usual order.

Non-Archimedean case:

 $\Lambda = \mathbb{Z}^2$ with the right lexicographic order:

 $(a,b) < (c,d) \iff b < d \text{ or } b = d \text{ and } a < c.$

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Λ-trees

Morgan and Shalen (1985) defined A-trees:

A Λ -tree is a metric space (X, p) (where $p : X \times X \to \Lambda$) which satisfies the following properties:

- 1) (X, p) is geodesic,
- 2) if two segments of (X, p) intersect in a single point, which is an endpoint of both, then their union is a segment,
- 3) the intersection of two segments with a common endpoint is also a segment.

Alperin and Bass (1987) developed the theory of Λ -trees and stated the fundamental research goals:

Find the group theoretic information carried by an action on a $\Lambda\text{-}\text{tree}.$

Λ-trees

Morgan and Shalen (1985) defined A-trees:

A Λ -tree is a metric space (X, p) (where $p : X \times X \to \Lambda$) which satisfies the following properties:

Finitely generated \mathbb{R} -free groups

Rips' Theorem [Rips, 1991 - not published]

A f.g. group acts freely on \mathbb{R} -tree if and only if it is a free product of surface groups (except for the non-orientable surfaces of genus 1,2, 3) and free abelian groups of finite rank.

Gaboriau, Levitt, Paulin (1994) gave a complete proof of Rips' Theorem.

Bestvina, Feighn (1995) gave another proof of Rips' Theorem proving a more general result for stable actions on \mathbb{R} -trees.

Properties

Some properties of groups acting freely on Λ -trees (Λ -free groups)

- The class of Λ-free groups is closed under taking subgroups and free products.
- **2** Λ -free groups are torsion-free.
- Λ-free groups have the CSA-property (maximal abelian subgroups are malnormal).
- Commutativity is a transitive relation on the set of non-trivial elements.
- Any two-generator subgroup of a Λ-free group is either free or free abelian.

The following is a principal step in the Alperin-Bass' program:

Open Problem [Rips, Bass]

Describe finitely generated groups acting freely on Λ -trees.

Here "describe" means "describe in the standard group-theoretic terms".

We solved this problem for finitely presented groups. Λ-free groups = groups acting freely on Λ-trees.

Non-Archimedean actions

Theorem (H.Bass, 1991)

A finitely generated $(\Lambda \oplus \mathbb{Z})$ -free group is the fundamental group of a finite graph of groups with properties:

- vertex groups are Λ-free,
- edge groups are maximal abelian (in the vertex groups),
- edge groups embed into Λ.

Since $\mathbb{Z}^n \simeq \mathbb{Z}^{n-1} \oplus \mathbb{Z}$ this gives the algebraic structure of \mathbb{Z}^n -free groups.

Actions on \mathbb{R}^n -trees

Theorem [Guirardel, 2003]

A f.g. freely indecomposable \mathbb{R}^{n} -free group is isomorphic to the fundamental group of a finite graph of groups, where each vertex group is f.g. \mathbb{R}^{n-1} -free, and each edge group is cyclic.

However, the converse is not true.

Corollary A f.g. \mathbb{R}^n -free group is hyperbolic relative to abelian subgroups.

Notice, that \mathbb{Z}^n -free groups are \mathbb{R}^n -free.

Actions on \mathbb{R}^n -trees

Theorem [Guirardel, 2003]

A f.g. freely indecomposable \mathbb{R}^{n} -free group is isomorphic to the fundamental group of a finite graph of groups, where each vertex group is f.g. \mathbb{R}^{n-1} -free, and each edge group is cyclic.

However, the converse is not true.

Corollary A f.g. \mathbb{R}^n -free group is hyperbolic relative to abelian subgroups.

Notice, that \mathbb{Z}^n -free groups are \mathbb{R}^n -free.

From actions to length functions

Let G be a group acting on a Λ -tree (X, d). Fix a point $x_0 \in X$ and consider a function $I : G \to \Lambda$ defined by

$$l(g)=d(x_0 \ , \ gx_0)$$

I is called a based length function on G with respect to x_0 , or a Lyndon length function.

I is free if the underlying action is free.

Example. In a free group *F*, the function $f \rightarrow |f|$ is a free \mathbb{Z} -valued (Lyndon) length function.

Regular action

Definition

Let G act on a Λ -tree Γ . The action is regular with respect to $x \in \Gamma$ if for any $g, h \in G$ there exists $f \in G$ such that $[x, fx] = [x, gx] \cap [x, hx]$. We say that G is complete.

Comments

Let G act on a Λ -tree (Γ, d) . Then the action of G is regular with respect to $x \in \Gamma$ if and only if the length function $l_x : G \to \Lambda$ based at x is regular.

Let G act minimally on a Λ -tree Γ . If the action of G is regular with respect to $x \in \Gamma$ then all branch points of Γ are G-equivalent. Let G act on a Λ -tree Γ . If the action of G is regular with respect to $x \in \Gamma$ then it is regular with respect to any $y \in Gx$.

Main Theorems

Theorem

[KMS] Any f.p. complete Λ -free group G can be represented as a union of a finite series of groups

$$G_1 < G_2 < \cdots < G_n = G,$$

where

- G_1 is a free group,
- G_{i+1} is obtained from G_i by finitely many HNN-extensions in which associated subgroups are maximal abelian and length isomorphic as subgroups of Λ.

Length functions

Length functions were introduced by Lyndon (1963).

Let G be a group. A function $I : G \to \Lambda$ is called a length function on G if

(L1) $\forall g \in G : l(g) \ge 0$ and l(1) = 0, (L2) $\forall g \in G : l(g) = l(g^{-1})$, (L3) the triple $\{c(g, f), c(g, h), c(f, h)\}$ is isosceles for all $g, f, h \in G$, where c(f, g) is the Gromov's product:

$$c(g, f) = \frac{1}{2}(I(g) + I(f) - I(g^{-1}f)).$$

 $\{a, b, c\}$ is isosceles = at least two of a, b, c are equal, and not greater than the third.

Chiswell's Theorem

Theorem [Chiswell]

Let $L: G \to \Lambda$ be a Lyndon length function on a group G. Then there exists a Λ -tree $(X, d), x \in X$, and an isometric action of Gon X such that L(g) = d(x, gx) for all $g \in G$.

Notice that L(g) = d(x, gx) is free iff the action of G on X is free.

This gives another approach to free actions on Λ-trees.

$$\forall g, f \in G, \exists u, g_1, f_1 \in G :$$

 $g = u \circ g_1 \& f = u \circ f_1 \& l(u) = c(g, f).$

Complete subgroups

Let $G \leq CDR(\Lambda, X)$ be a group of infinite words.

Complete subgroups

 $G \leq CDR(\Lambda, X)$ is complete if G contains the common initial segment c(g, h) for every pair of elements $g, h \in G$.

Regular length functions

A Lyndon length function $L : G \to \Lambda$ is regular if there exists a length preserving embedding $G \to CDR(\Lambda, X)$ onto a complete subgroup.

Complete subgroups

Example. Let F(x, y) be a free group and $H = \langle x^2 y^2, xy \rangle$ be its subgroup.

F has natural free \mathbb{Z} -valued length function $I_F : f \to |f|$. Hence, I_F induces a length function I_H on *H*.

 I_F is regular, but I_H is not

< ロ > < 同 > < 回 > < 回 > < 回 > <

Take
$$g = xy^{-1}x^{-2}$$
, $h = xy^{-1}x^{-1}y$ in F . Then
 $g, h \in H$, but $com(g, h) = xy^{-1}x^{-1} \notin H$.

Branch points and completeness

A vertex $p \in \Gamma(G)$ is a branch point if it is the terminal endpoint of the common initial segment u = com(g, h) of $g, h \in G$.

Completeness \implies all branch points are in one *G*-orbit of Γ

Elimination process

Elimination Process (EP) is a dynamical (rewriting) process of a certain type that transforms formal systems of equations in groups or semigroups (or band complexes, or foliated 2-complexes, or partial isometries of multi-intervals). Makanin (1982): Initial version of EP.

Makanin's EP gives a decision algorithm to verify consistency of a given system of equations - decidability of the Diophantine problem over free groups.

(日) (同) (三) (三)

Razborov's process

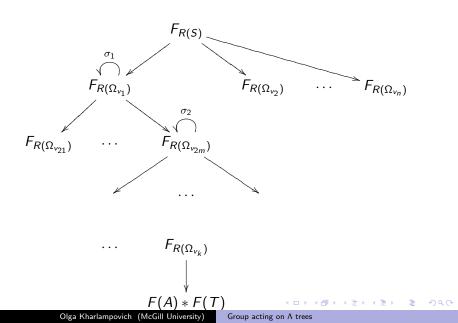

Razborov (1987): developed EP much further. Razborov's EP produces all solutions of a given system in *F*. The *coordinate group* of S = 1: $F_{R(S)} = F(A \cup X)/Rad(S)$

(4月) イヨト イヨト

Razborov's process

Razborov (1987): developed EP much further. Razborov's EP produces **all solutions** of a given system in *F*. The *coordinate group* of S = 1: $F_{R(S)} = F(A \cup X)/Rad(S)$

(4月) イヨト イヨト

Kharlampovich - Myasnikov (1998):

Refined Razborov's process.

Effective description of solutions of equations in free (and fully residually free) groups in terms of very particular **triangular systems** of equations.

Resembles the classical elimination theory for polynomials.

(4月) (4日) (4日)

Elimination process and splittings

A **splitting** of G is a representation of G as the fundamental groups of a graph of groups.

A splitting is **cyclic (abelian)** if all the edge groups are cyclic (abelian).

Elementary splittings:

$$G = A *_C B$$
, $G = A *_C = \langle A, t \mid t^{-1}Ct = C' \rangle$,

Free splittings:

G = A * B

Elimination processes and free actions

Infinite branches of an elimination process correspond precisely to the standard types of free actions: linear case ⇔ thin (or Levitt) type the quadratic case ⇔ surface type (or interval exchange), periodic structures ⇔ toral (or axial) type.

Bestvina-Feighn's elimination process

A powerful variation of the Makanin-Razborov's process for $\mathbb{R}\text{-}\mathsf{actions.}$

Can be viewed as an asymptotic (limit) version of MR process. Much simpler in applications but not algorithmic.

KM elimination process for \mathbb{Z}^n actions

To solve equations in fully residually free groups we designed a variation of the elimination process for \mathbb{Z}^n actions.

It **effectively** describes solution sets of finite systems of equations in \mathbb{Z}^n -groups in terms of **Triangular quasi-quadratic systems** (as in the case of fully residually free groups).

• • = • • = •

Non-standard version of Rip's machine

Kh., **Myasnikov**, and **Serbin** designed an elimination process for arbitrary non-Archimedean actions, i.e, free actions on Λ-trees.

This can be viewed as a **non-Archimedean (non-standard)** discrete, effective version of the original MR process.

Sketch of the proof of the theorem about Λ -free f.p. groups

Let G have a regular free length function in Λ .

Fix an embedding of G into $CDR(\Lambda, X)$ and construct a cancellation tree for each relation of G.

同 ト イ ヨ ト イ ヨ ト

Sketch of the proof

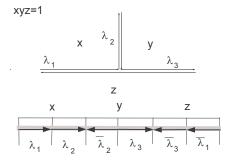

Figure: From the cancellation tree for the relation xyz = 1 to the generalized equation $(x = \lambda_1 \circ \lambda_2, y = \lambda_2^{-1} \circ \lambda_3, z = \lambda_3^{-1} \circ \lambda_1^{-1})$.

(人間) ト く ヨ ト く ヨ ト

Sketch of the proof

Infinite branches of an elimination process correspond to abelian splittings of *G*:

linear case \iff splitting as a free product.

the quadratic case \iff QH-subgroup,

periodic structures \iff **abelian** vertex group or splitting as an HNN with abelian edge group.

After obtaining a splitting we apply EP to the vertex groups. We build the Delzant-Potyagailo hierarchy.

Sketch of the proof

A family C of subgroups of a torsion-free group G is called *elementary* if

- (a) ${\mathcal C}$ is closed under taking subgroups and conjugation,
- (b) every $C \in C$ is contained in a maximal subgroup $\overline{C} \in C$,
- (c) every $C \in C$ is small (does not contain F_2 as a subgroup),
- (d) all maximal subgroups from C are malnormal.

G admits a *hierarchy* over C if the process of decomposing *G* into an amalgamated product or an HNN-extension over a subgroup from C, then decomposing factors of *G* into amalgamated products and/or HNN-extensions over a subgroup from C etc. eventually stops.

Theorem (Delzant - Potyagailo (2001)). If G is a finitely presented group without 2-torsion and C is a family of elementary subgroups of G then G admits a hierarchy over C.
